## REEF Subsonic Wind Tunnel Articulating Robotic Arm

SPONSORS MICHAEL SYTSMA KEN BLACKBURN ADVISOR DR. RAJAN KUMAR INSTRUCTORS DR. NIKHIL GUPTA DR. CHIANG SHIH TEAM 12 ANDREW BALDWIN JUSTIN BROOMALL CAITLAN SCHEANWALD JACOB KRAFT

**REEF Subsonic WT Articulating Arm** 

Team #12

#### **Problem Statement**

- The design and production of a cost effective mechanism that would hold and adjust the orientation of a specimen being tested in a subsonic wind tunnel
- The current arm and mount are being removed, therefore a new system is needed in order for testing to continue
  - Quotes from companies that will design/build systems exceed \$100,000
  - Working budget of \$2,000

#### Wind Tunnels

- Research tool to recreate flight conditions
- Cost effective, controlled environment
- Models scalable through the use of dimensionless properties

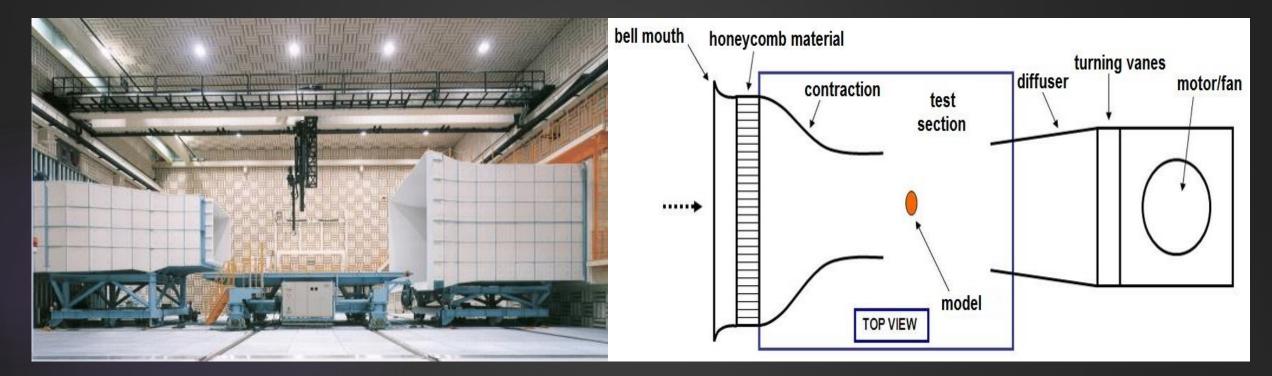

#### Sting Mount in Wind Tunnel

Slide 4 of 27

#### **Project Objective**

- Arm able to withstand maximum force generated by wind tunnel
  - Maximum Velocity: 22 m/s
- Center of mass of specimen must not change during manipulation
- Adjustable pitch range: -5° to +20°
- Adjustable yaw range: ±10°
- Model must not move when in set position
- User interface to control motion of arc

**Team #12**

Slide 5 of 27

## **Design Constraints**

- User interface using LabVIEW
- Motion Controller design
- 0.25° orientation accuracy
- Maximum deflection of 0.25 in.
- Factor of safety of 5
- \$2,000 budget

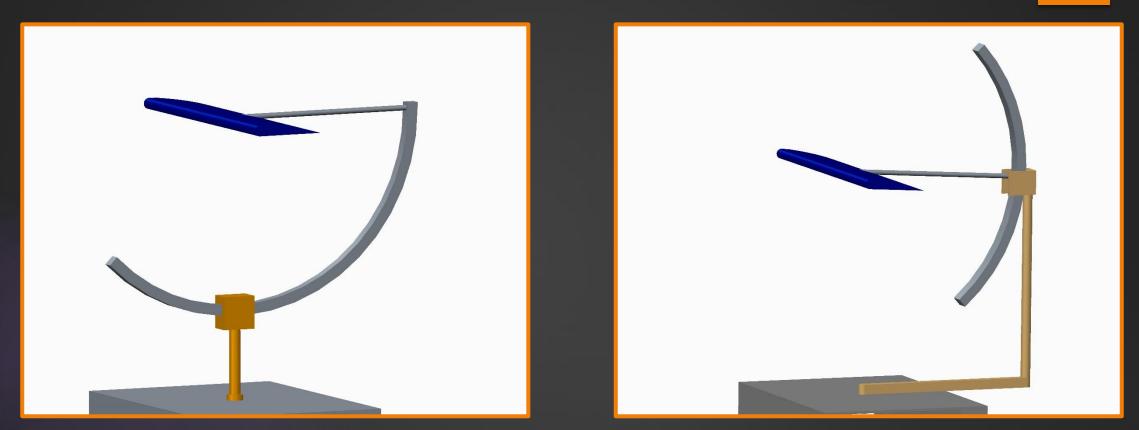

**Justin Broomall** 

**REEF Subsonic WT Articulating Arm** 

Team #12

#### **Initial Design Concepts**

Design 1: Horizontal Translation arc Low motor location, small turn table moment Design 2: Vertical Translation arc High motor location, large moment

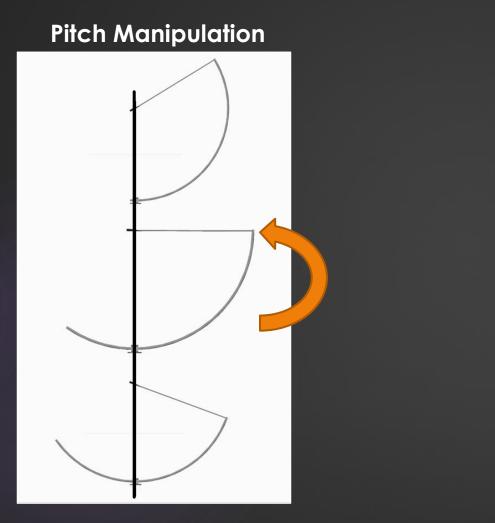

**Team #12**

#### Final Mechanical Design

#### Main Components:

- Sting
- Arc
- Follower
- Main Housing
- Drive Train Housing
- Rotary Table

#### **Stress and Deflection Analysis**

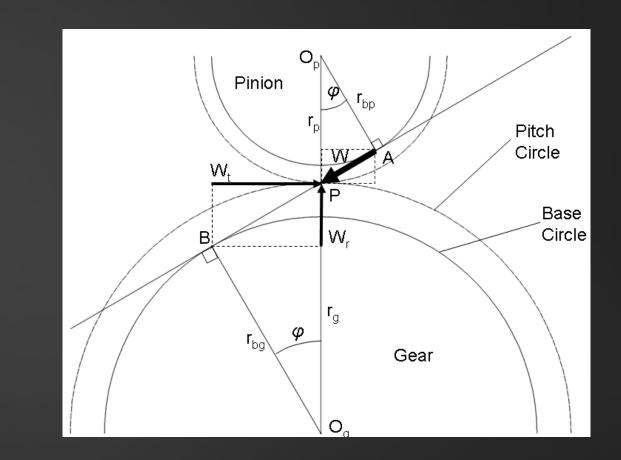

**REEF Subsonic WT Articulating Arm** 

Slide 14 of 27

#### **Reliability Analysis**

- Place of highest stress → Spur gear teeth
  - Hardened Acetal material (Delrin)
  - Required stress analysis
- Bending stress
  - Stressing factors such as time, temperature, actuation speed, application
  - Max allowable force (Wt) of 23lbf
  - Induced force (Wt) of 10lbf
  - Factor of Safety  $\approx 2.3$
  - Conservative estimates built in

Slide 15 of 27

## Life-Cycle Analysis (LCA)

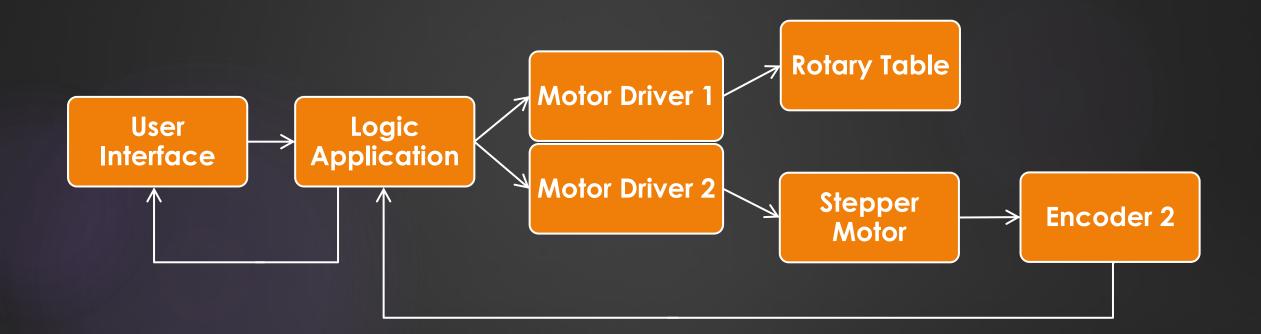

- Location of most wear:
  - Location of largest forces, most use, and weakest material
  - Plastic driving spur
- Surface Strength
  - Stressing factors such as bending stress, speed, time, temperature, application
  - Max Surface Strength  $\approx 4 \frac{kgf}{mm^2}$  (39 MPa)  $\rightarrow$  105 cycles
  - Cycles/hr  $\approx$  900  $\rightarrow$  Life of  $\approx$  111 hours

۱ 💮 💮

**Caitlan Scheanwald** 

#### **Programming Communication**

- Galil motion controller uses DMC (Digital Motion Controller) code
- GalilTools software has an integrated library to use LabVIEW with the Galil controller
- LabVIEW can download programs to the Galil and send commands (as long as they don't contradict the loaded program)

Caitlan Scheanwald

## Ideal Logic Configuration

- User input of angles in LabVIEW
  - System will have a "reset"
- Input communication and processing
- Motors actuate the arc to the specified angles
  - New angles will not be able to be entered while the arc is in motion
- Encoders feedback to controller
- Return to LabVIEW interface that actuation is completed
- User can enter new angles or reset the system
- Emergency stop

#### **Design Economics**

Costs Reduction Techniques:

- Consumer Off the Shelf Parts
- Machining Completed at FSU/ CoE Facilities
- Sponsor Provided Controller and Rotary Table
- Price Shopping For Raw Metal

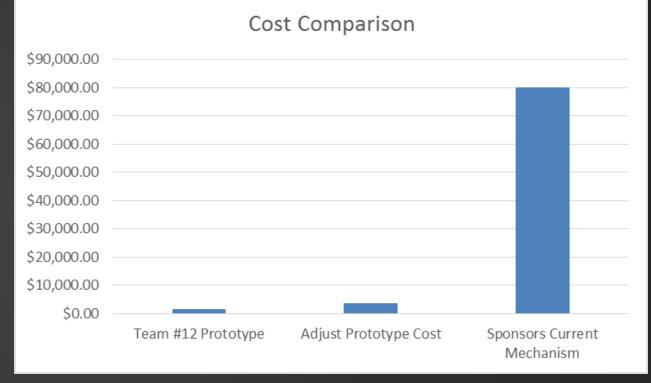

Team #12

Jacob Kraft

#### Design Economics Cont...

- Team #12 Prototype \$1,364
- Adjusted Prototype \$3,659
- Accounts for sponsor donated materials
- Sponsors Current Mechanism -\$80,000
- The produced prototype is the most cost effective of the current options

Slide 23 of 27

Jacob Kraft

#### **Expectations vs. Results**

#### Achieved Goals

- Pitch range: -5° to +20°
- Yaw range: ±10°
- Constant center of mass location
- Model remains still when arc inactive
- Arc controlled by user interface
- Successful actuation under load

## Goals in Progress

- Withstand maximum forces generated by wind tunnel
  - Can only be tested upon delivery to sponsor

**Team #12** 

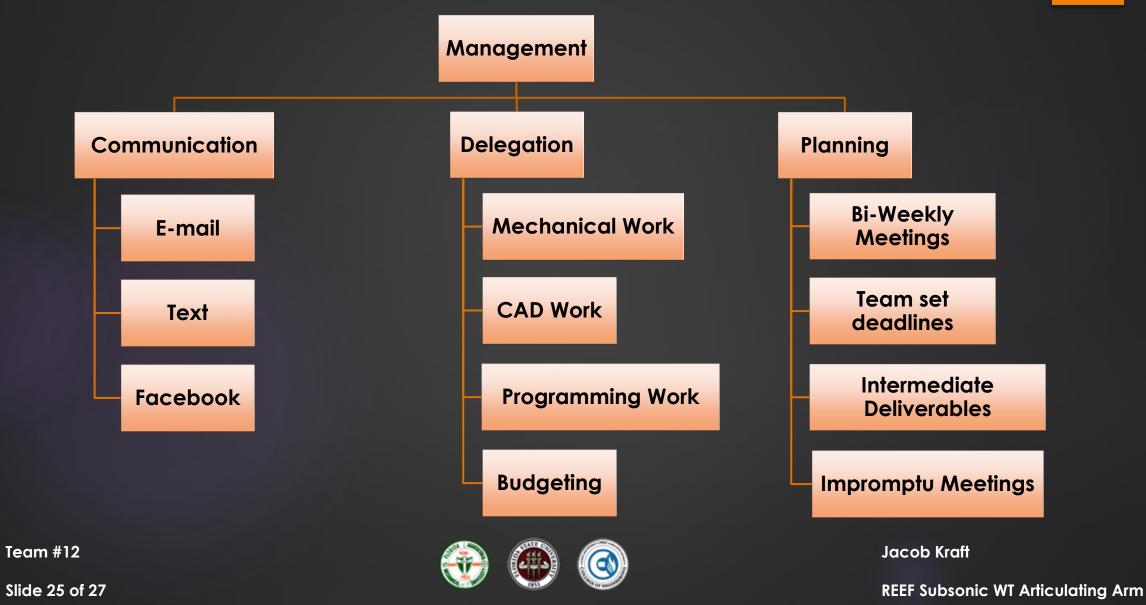

Slide 24 of 27

Jacob Kraft

#### Project Management

## Summary

- What we learned:
  - Time management
  - Project Management
  - Team Work
  - Work Delegation
  - Presentation Skills
  - Work in detail

- Future Modifications:
  - Gyroscope
  - Turn-table encoder
  - GUI improvements
